# Abstract

This thesis aims to present a thorough investigation of the theory underlying multiple-target tracking. The overarching goal will be to present the theory in a condensed setting, such that the practical aspect of this challenge is within reach. Multiple-target tracking will be split up into its two main components, namely single-target tracking and data association. These will further be divided into smaller problems, to explain the underlying mathematical structure necessary for solving the problems, and subsequently applying these in a practical setting. A modified approach in data association will be presented and evaluated, which is a necessary modification for dealing with a certain subset of problems that was encountered throughout the process of writing the thesis. This introduced approach will be compared to existing methods in regards to computational running time, to evaluate if it has any practical use. For evaluating the implemented model for tracking, it will be applied to both simulated data, and data from the real world. Here the data from the real world was supplied by Scio+, where the goal in mind with this was to track the movements of livestock in an enclosure. This thesis was done in collaboration with Scio+, who is a part of SKOV A/S.

# Contents

<b>1 Introduction</b>	<b>5</b>
<b>2 Single-Target Tracking</b>	<b>7</b>
2.1 Mathematical model	7
2.2 Dynamical systems	8
2.2.1 Discrete time representation	9
2.3 Tracking filters	10
2.3.1 The $g$ - $h$ filter	10
2.3.2 The Kalman filter	13
2.3.2.1 Prediction step	13
2.3.2.2 Update step	14
2.3.2.3 Initialization step	15
2.3.3 Unscented Kalman filter	15
2.3.3.1 Sigma points	16
2.3.3.2 Running the algorithm	16
<b>3 Data Association</b>	<b>18</b>
3.1 Mathematical model	18
3.1.1 Linear sum assignment problem	19
3.1.2 Rectangular linear sum assignment problem	20
3.1.3 Primal-dual problem	21
3.2 Association algorithms prerequisites	22
3.2.1 Admissible transformation	22
3.2.2 Augmenting path	23
3.3 Association algorithms	24
3.3.1 The Hungarian algorithm	24
3.3.2 The Jonker-Volgenant algorithm	25
3.3.3 Modified Jonker-Volgenant	27
<b>4 Multiple-Target Tracking</b>	<b>29</b>
4.1 Modified LAPMOD algorithm	29
4.2 Noisy measurements	32
4.2.1 Missing measurements	32
4.2.2 Duplicated measurements	34
4.2.3 Non-existing measurements	34
4.3 Multiple-target tracking model	35

---

<b>5 Experiments</b>	<b>36</b>
5.1 Simulation experiment . . . . .	36
5.2 Running time experiments . . . . .	42
5.2.1 General setup . . . . .	42
5.2.2 Comparing the algorithms . . . . .	42
5.2.3 Time complexity of the algorithms . . . . .	44
<b>6 Discussion</b>	<b>48</b>
<b>7 Conclusion</b>	<b>51</b>
